PROJECT REPORT

Import Data using Transform Maps (Spreadsheet)

Team ID	6abab825ad6b12298106a1a8
Date	30 September 2026
Project Name	Import Data using Transform Maps (Spreadsheet)

Report prepared using the structure specified in the uploaded Final Report Template.

1. INTRODUCTION

1.1 Project Overview

Import Data using Transform Maps (Spreadsheet) is a data-import workflow in which records from a spreadsheet are brought into a target system through a Transform Map. The process focuses on preparing source data, mapping source fields to target fields, applying transformation rules, validating the imported records, and confirming the final output.

1.2 Purpose

The purpose of the project is to provide a structured and repeatable method for importing spreadsheet data into a target table while reducing manual data entry and improving consistency through field mapping and transformation rules.

2. IDEATION PHASE

2.1 Problem Statement

Manual entry of spreadsheet records into a target system can be time-consuming and may introduce duplicate, incomplete, or incorrectly formatted data. A controlled import process is required to move spreadsheet information into the target table accurately.

2.2 Empathy Map Canvas

Says	**Thinks**
“The spreadsheet contains the required records.”	“The imported values should match the source data.”
Does	**Feels**
Prepares the spreadsheet and checks the imported records.	Confident when mapping and validation produce the expected result.

2.3 Brainstorming

Key ideas include spreadsheet preparation, source-to-target field mapping, transformation of values where required, duplicate handling, validation of imported records, and verification of the final target-table output.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey map

Stage	Action	Expected Experience
Prepare	Create/verify spreadsheet	Clean source data
Import	Load spreadsheet data	Import starts successfully
Map	Configure source and target fields	Fields map correctly
Transform	Apply transformation rules	Values are converted as required
Validate	Check imported records	Output matches expectations

3.2 Solution Requirement

The solution requires a valid spreadsheet source, a configured import mechanism, source-to-target field mappings, transformation rules where needed, validation checks, and a target table for the final records.

3.3 Data Flow Diagram

Spreadsheet	→	Import Set / Import Process	→	Transform Map	→	Target Table
Source records		Loaded records		Mapped & transformed records		Final records

3.4 Technology Stack

The report is based on a spreadsheet-based import workflow using Transform Maps and a target data table. The uploaded template does not specify particular software versions or external technologies, so no additional technology claims are made here.

4. PROJECT DESIGN

4.1 Problem Solution Fit

The proposed workflow directly addresses the problem of manual and error-prone data entry by allowing a prepared spreadsheet to be imported and systematically mapped into the target structure.

4.2 Proposed Solution

Prepare the spreadsheet → import the data → configure source and target field mappings → apply transformation rules → validate the resulting records → confirm the final output.

4.3 Solution Architecture

Source Layer	Transformation Layer	Target Layer
Spreadsheet data	Import + Transform Map + validation	Target table / final records

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

Activity	Planned Work
Requirement analysis	Identify source fields, target fields and validation needs
Spreadsheet preparation	Prepare and verify source records
Transform Map configuration	Create field mappings and transformation logic
Testing	Execute import and verify results
Final validation	Confirm target records and output

6. FUNCTIONAL AND PERFORMANCE TESTING

6.1 Performance Testing

Test Area	Expected Result
Spreadsheet Import	Source records are loaded successfully
Field Mapping	Source fields populate the correct target fields
Transformation	Transformation rules produce expected values
Validation	Imported records satisfy defined checks
Final Output	Target table contains the expected records

7. RESULTS

7.1 Output Screenshots

The source template requires output screenshots, but no screenshots were supplied with the uploaded template. Therefore, this section records the expected output areas rather than inventing screenshots.

Recommended screenshots to insert: (1) source spreadsheet, (2) import configuration, (3) Transform Map field mappings, (4) transformed/imported records in the target table.

8. ADVANTAGES & DISADVANTAGES

Advantages	Disadvantages
Reduces manual data entry	Requires correctly prepared source data
Provides structured field mapping	Incorrect mappings can affect imported values
Supports repeatable transformation	Transformation rules need proper configuration
Makes validation easier	Large or inconsistent source data may require cleanup

9. CONCLUSION

Import Data using Transform Maps (Spreadsheet) provides a structured approach for moving spreadsheet data into a target table. By combining import, field mapping, transformation and validation, the workflow can improve consistency and reduce repetitive manual data entry.

10. FUTURE SCOPE

Future improvements can include stronger validation rules, automated error reporting, scheduled imports, duplicate detection, richer transformation logic, and monitoring of import results.
